

Abstract

This project focuses on creating a simplified replica of the Kawasaki website homepage using only HTML and CSS. The aim was to gain practical experience with front-end development by designing a visually appealing and structured layout similar to that of a major e-commerce platform. By recreating key elements of the Kawasaki homepage—such as the navigation bar, product display grid, and footer; this project provided a hands-on approach to understanding webpage structuring and styling fundamentals.

The development process involved breaking down the homepage into separate sections and implementing each using HTML for structure and CSS for styling. Key design techniques included the use of CSS Flexbox for responsive layouts, along with media queries to adapt the design across various screen sizes, ensuring a seamless UI. The colour scheme and layout were crafted to align closely with Kawasaki's branding, focusing visual coherence.

Despite the limitations and challenges like not knowing all of the properties which, the project effectively replicates the static design of Kawasaki's homepage, highlighting how HTML and CSS alone can be used to achieve a polished, professional layout, hence got to learn a lot.

This project demonstrated the power of CSS in creating responsive, well-structured designs and improved my proficiency in front-end web development.

List of Symbols, Abbreviations and Nomenclature

UI: User Interface

HTML: Hypertext Markup Language

CSS: Cascading Style Sheets

Introduction and Project Scope

Chapter 1

Objective:

This project replicates the Kawasaki homepage using HTML and CSS to develop front-end web development skills, focusing on layout structuring and responsive design.

Scope:

The project covers creating the homepage layout, including the navigation bar, product grid and footer, without JavaScript or back-end functionalities. The goal is to make the page responsive across different screen sizes using CSS.

Chapter 2

Methodology and Development Process

Design:

The page was broken into key components: header, navigation bar, product grid, banners, and footer. The layout was structured using HTML5 tags and styled using CSS techniques like Flexbox and Grid.

HTML Structure:

HTML tags like <header>, <div>, and <footer> were used to organize content. Additional tags like <a> helped structure to add the images.

CSS Techniques:

- Display, alignment arrangement of text and images properly.
- CSS Grid for the product grid.

Chapter 3

Key Features and Implementation

- Search bar
- Navigation bar
- Main body which includes genres of product images with gridding.
- Footer which includes go back to top panel, several lists and copyright line

Appendices
